

Client

Problems

AlphaPoint needed an integration solution for their data center information management solution AssetCentral

Project Gestalt Role

- > Solution architect
- > Development management
- > Off-shore development services
- > Quality control
- > Management of solution testing at Alphapoint customer's site

Technologies

- > PHP
- > APC ISX web services

Solution

Project Gestalt led the development of an integration solution for AssetCentral—AlphaPoint’s data center information management software. Project Gestalt worked AlphaPoint’s application architect and AlphaPoint enterprise customers to define requirements, and coordinated interaction with vendors with which software AssetCentral would integrate. Project Gestalt led the developmet team including AlphaPoint developers and Project Gestalt off-shore developers to provide a cost effective implementation.

The results:

- > Delivered a new integration framework for AssetCentral that enables the integrations with the initial partners and will support rapid integration with future partners
- > Integration framework manages definitions of external data sources that provide data and the rules and timing for data updates
- > Implemented the “web service/xml results connector type
- > Established flexible entities in AssetCentral for asset-related attributes collected and maintained in other systems
- > Provided business value with cost effective development team integrating internal and off-shore development resources
